(Appendices)**

**R & D Project
(BAW - BfG)**

October 2008

List of Appendices

Appendices to Chapter 4

- Appendix 4.1 Planning
- Appendix 4.2 Vegetation and bank structure; survey from 1989
- Appendix 4.2-1 Sections 1 - 8*
- Appendix 4.2-2 Sections 9 - 15*
- Appendix 4.3 Detailed planning of the WSA Verden 1989
- Appendix 4.4 Description of the measures implemented by the WSA Verden, execution of construction and work costs, 1989
- Appendix 4.5 Compilation of costs

Appendices to Chapter 5

- Appendix 5.1 Site map (cross sections, soundings)
- Appendix 5.2 Soil data
- Appendix 5.2-1 Results of borings BS 001 / BS 002*
- Appendix 5.2-2 Results of borings BS 001 / BS 004*
- Appendix 5.2-3 Results of borings BS 001 / BS 006*
- Appendix 5.3 Grading curves
- Appendix 5.3-1 Grading curve sands and silts*
- Appendix 5.3-2 Grading curve silts*
- Appendix 5.3-3 Grading Weser gravel*
- Appendix 5.4 Site plan (ground water measurement points)*
- Appendix 5.5 Ground water
- Appendix 5.5-1 Ground water hydrographs, 1988 - 2004*
- Appendix 5.5-2 Ground water hydrographs, 1994 - 1995*
- Appendix 5.5-3 Analysis of ground water measurements*
- Appendix 5.6 Water level hydrographs November 1988 – August 2006 plotted over cross sections at the right bank
- Appendix 5.6-1 Cross section Km 241.500*
- Appendix 5.6-2 Cross section Km 241.600*
- Appendix 5.6-3 Cross section Km 241.650*
- Appendix 5.6-4 Cross section Km 241.750*

Appendix 5.6-5 Cross section Km 241.800

Appendix 5.6-6 Cross section Km 241.850

Appendix 5.6-7 Cross section Km 241.950

Appendix 5.6-8 Cross section Km 242.000

Appendix 5.6-9 Cross section Km 242.040

Appendix 5.6-10 Cross section Km 242.170

Appendix 5.6-11 Cross section Km 241.200

Appendix 5.6-12 Cross section Km 242.400

Appendix 5.6-13 Cross section Km 242.500

Appendix 5.7 Days of flooding and water level frequencies at Stolzenau gauge

Appendix 5.7-0 Days of flooding

Appendix 5.7-1 Frequencies of water levels 1989/1990

Appendix 5.7-2 Frequencies of water levels 1991/1992

Appendix 5.7-3 Frequencies of water levels 1993/1994

Appendix 5.7-4 Frequencies of water levels 1995/1996

Appendix 5.7-5 Frequencies of water levels 1997/1998

Appendix 5.7-6 Frequencies of water levels 1999/2000

Appendix 5.7-7 Frequencies of water levels 2001/2002

Appendix 5.7-8 Frequencies of water levels 2003/2004

Appendix 5.7-9 Frequencies of water levels 2005/2006

Appendices to chapter 9

Appendix 9.1 Vegetation and bank structure; survey from Sept. 1999

Appendix 9.1-1 Sections 1 - 8

Appendix 9.1-2 Sections 9 - 15

Appendix 9.2 Vegetation and bank structure; survey from April 2005

Appendix 9.2-1 Sections 1 - 8

Appendix 9.2-2 Sections 9 - 15

Appendix 9.3 Location of photographs with direction of view and photograph numbers

Appendix 9.4 Photographic documentation

Appendix 9.5 Hinterland (Km 242.100)

Appendix 9.6 Bank vegetation directly upstream from the test stretch

Appendix 9.7 Bank opposite the test stretch (Km 242.100)

Appendix 9.8 Complete list of plant species in the test stretch

Appendices to chapter 10

Appendix 10.1 Taxa lists MZB River Weser at Stolzenau, May 2006

Appendix 10.1-1 Taxa lists of the samples W1 – W10 in the area AU1

Appendix 10.1-2 Taxa lists of the samples W11 – W20 in the area AU2

Appendix 10.1-3 Taxa lists of the samples W21 – W30 in the area RU

Appendix 10.2 Distribution of constancy, dominance, animal groups and ecological features of the MZB River Weser at Stolzenau, May 2006

Appendix 10.2-1 Constancy distribution of the MZB

Appendix 10.2-2 Dominance distribution of the MZB

Appendix 10.2-3 Animal group distribution of the MZB

Appendix 10.2-4 Ecological features of the MZB

Appendices to chapter 12

Appendix 12.1 Specification test stretch Stolzenau, River Weser Km 241.550 – 242.300, right bank

Appendix 12.2 Recommendations for a monitoring programme

Planting plan for root plugs

WSA Verden, 23.3.1989 / Treese, TAn

COVER SHEET for Cross section 9 from draft dated 23.9.1988 of the BfG Koblenz

WSA Verden, 23.3.1989 | Frerck, Tang

Appendix 4.4

Description of the measures implemented by the WSA Verden, execution of construction work and costs, 1989

Appendix 4.4 – Description of the measures implemented by the WSA Verden, execution of construction work and costs, 1989

1.3 Description of the measures

In the vicinity of Stolzenau, a 750 m long section of riverbank (Weser Km 242.550 to Weser Km 242.300, right bank) shall be prepared for the testing of bioengineering construction methods in cooperation with the Federal Institute for Hydrology (BfG).

The various preliminary construction works that are required can be subdivided as follows:

1.3.1 Hydraulic engineering measures

In this area, there were groynes which were completely destroyed above the waterline. These groynes were rebuilt in their original dimensions.

In order to compare the individual types of groyne construction with regard to production costs, durability and effectiveness of protection for the planting work, the groynes were repaired using a variety of techniques.

Of the five groynes which lie inside the test stretch, two groynes were paved, two consist of riprap and one of packed stone.

The structural design of the individual groynes can be seen in Appendix A2. A total of 70 t of paving stones, 315 t of riprap and 250 t of gravel were used to repair the groynes.

The groyne fields that were reconstructed by these means are divided up by stone mounds of riprap with varying heights. The mounds run parallel to the bank line, at a distance of 5 m. The areas between the stone mound and the bank were filled with gravel to a level of 0.10 m below hydrostatic water level in order to create shallow water zones for the planting of reed plants.

The stone mounds simultaneously serve to reduce the force of waves generated by shipping.

The heights of the stone mounds can be seen in Appendix A1.

The construction of the mounds required 1400 t of riprap stone.

1.3.2 Earth works

For the planting of the reed beds, the banks, which in this section were partially still stabilised, were flattened and existing revetments were removed.

The flattening of the banks created a slope inclination of 1:5 in a section of 280 m in length and, on average, 4 m in width and 1 m in height, as measured from the water line.

The transitions from the flattened embankment to the in-situ soil were left as a vertical break in the surface. No remodelling was carried out in the transition area (see A3).

The existing breaks in the banks were flattened slightly and integrated into the test stretch in an otherwise unmodified form.

The revetments were removed in a section 80 m in length and on average 3 m in width (240 m^2).

1.3.3 Installation of the bioengineering elements

The entire stretch was divided into individual sections in which the various options for biological-technical bank settlement were to be tested. The individual elements can be specified as follows:

1.3.3.1 Sinking fascines

The sinking fascines were produced by the personnel of the local office of the WSA Verden at Windheim.

The 5 m long fascines were made from cut willow rods with a diameter of 0.30 m which were tied into bundles.

They were installed between two rows of wooden stakes. The stakes were driven into the ground 0.5 m apart and in rows 0.30 m apart, and braced with criss-cross wires. The bracing serves to prevent the fascines from swelling.

All in all, 70 running metres of fascines were installed in a single layer to protect the newly planted reed beds from wave action.

At the same time, a vegetation fascine with a total length of 10 m (diameter 0.30 m) will be planted with sedges and reed tussocks from the company Bestmann and integrated into the test scheme.

1.3.3.2 Live brush mattresses

The material for the brush mattresses was gathered during essential tree maintenance work by the local office of the WSA Verden at Windheim. It consists of willow branches and twigs.

A 0.10 m thick live brush mattress will be installed at two sites of the test stretch, covering a total area of 300 m² on the cleared or flattened bank slope.

It will be secured with criss-cross wire bracing.

The toe of the live brush mattress is secured by embedding the end of the live brush mattress and weighing it down with riprap stone (see A4).

Simultaneously, two rows of willow cuttings are to be planted along the live brush mattress. These are to be placed 0.5 m apart in rows 1 m apart.

A total of 50 willow cuttings and approximately 30 m³ of branch and twig material will be used.

The live brush mattress serves as covering layer of living material in order to protect and stabilise newly installed bank slopes that are not too steep. The advantage is that the interwoven material provides mechanical protection for the bank until the willow cuttings can produce new shoots.

1.3.3.3 Planting of reed bed plants and woody plants

Protected by technical and technical-biological measures, planting was carried out on the flattened or existing slopes and in shallow water zones partly using plant material gathered by the office itself and partly plant material purchased from or provided by the two companies participating in the project.

Planting was carried out in single planting sections that were precisely specified. The chosen arrangement ensures that the individual planting sections can be clearly identified and examined.

On the one hand, planting represents the only protection for the bank and, on the other, planting will be carried out in conjunction with a woven coir fabric or coir mat as protection for the bank slope.

The individual options which will be tested in the test stretch include planting the bank with:

- a) reed and sedge plugs gathered by the office's own personnel
 - b) pre-cultivated reed and sedge tussocks
 - c) pre-cultivated common reed and sedge tussocks in conjunction with a woven coir fabric (vegetation fabric)
 - d) pre-cultivated common reed and sedge tussocks in conjunction with a coir mat (bio-erosion protection mat)
 - e) willow cuttings (1.0 m in length) gathered by own personnel
 - f) pre-cultivated vegetation mats or pallets planted with sedges and common reed plants
 - g) pre-cultivated willow plants

h) pre-cultivated alder

The test stretch was planted or covered with 680 gathered plants, 625 pre-cultivated plants, 367 cultivated willow plants, 133 gathered willow cuttings, 20 cultivated alders and 45 m² of vegetation mats or pallets, 25 m² of bio-erosion protection mats and 225 m² of vegetation fabric.

A distinction was made between gathered and cultivated plants to compare the growth of the individual plants under the same boundary conditions.

4.0 Execution of construction work

4.1 Execution timeline

The work required was carried out, with some interruptions due to high water events, in the period from November 1988 to May 1989.

4.2 Personnel

The work was largely carried out by the personnel of the local office of the WSA Verden at Windheim with support from the local office at Nienburg.

The detailed deployment of personnel is given in Appendix 5.

The detailed deployment of personnel can be calculated as 5 persons/day and one 5-day week.

5. Costs

5.1 Overall costs

The overall costs can be subdivided as follows:

Personnel costs	2,253	hours	x	35.00	DM/h	=	78,855.00	DM	
Equipment costs	Digger:	180	hours	x	500.00	DM/h	=	90,000.00	DM
	Caterpillar:	135	hours	x	150.00	DM/h	=	20,250.00	DM
Material costs									
	Riprap stone:	1,715	t	x	35.00	DM/t	=	51,450.00	DM
	Paving stones:	70	t	x	114.00	DM/t	=	7,980.00	DM
	Gravel:	150	t	x	0.00		=	0.00	DM
	Plants:	1,500						1,500.00	DM
								250,035.00	DM
Construction costs including management by the municipality (acc. to list from Windheim office, dated 13.7.1989)								335,035.00	DM

Statistics “System - River Weser - Ground water”

Explanation:

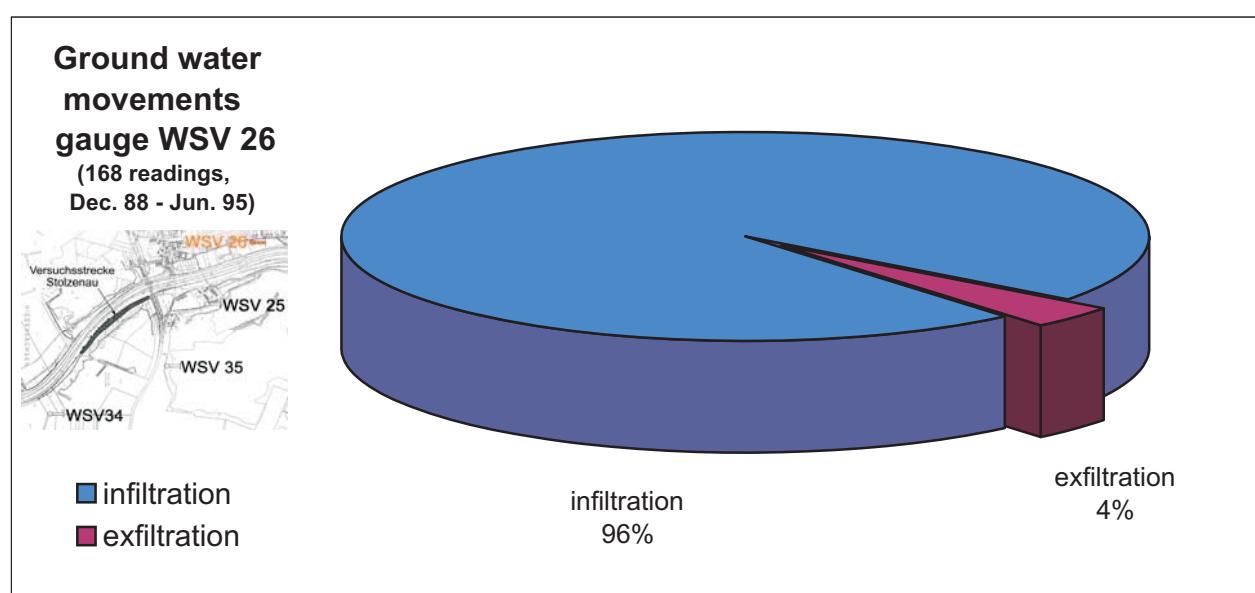

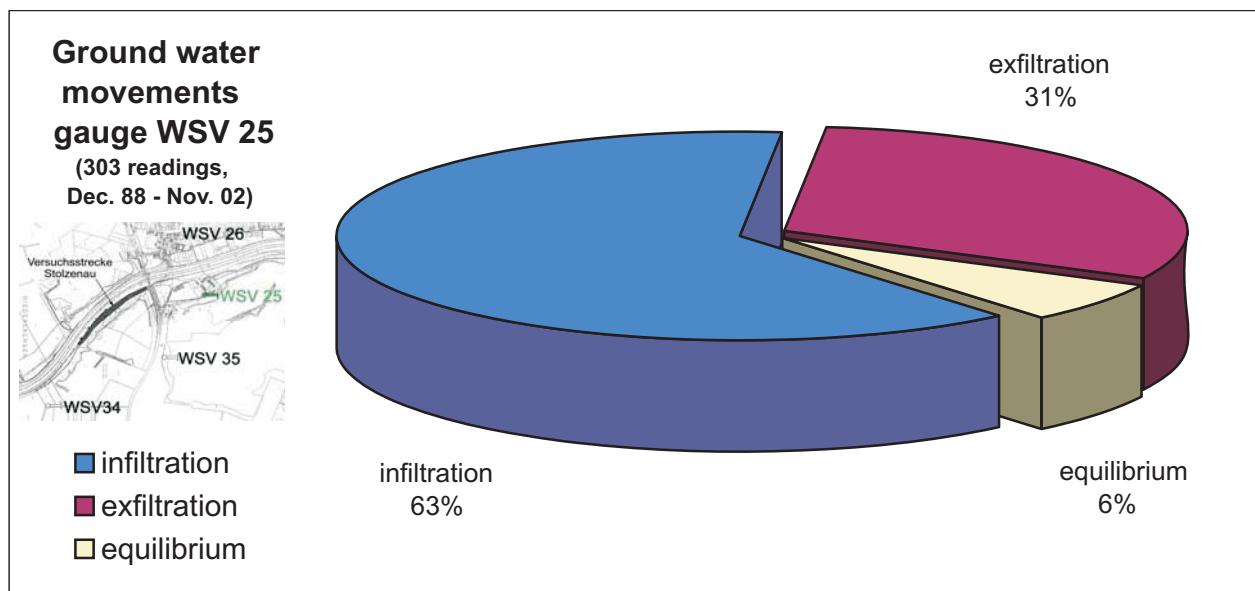

Infiltration: inflow of ground water to the River Weser as a result of a higher ground water table

Exfiltration: loss of river water as a result of a lower ground water table

Equilibrium: no gravity-related exchange of water thanks to equal levels in the water tables

The following data is based on readings taken between December 1988 and November 2002. Until 1998 the readings were taken every two weeks and thereafter at intervals of one month.

Ground water table	WSV 25	WSV 26	WSV 34	WSV 35	total
readings	303	168	290	290	1051
infiltration	190	162	245	216	813
exfiltration	94	6	39	58	197
equilibrium	19	0	6	16	41

KEY

Woody plants

single plants and shrubs

treelike and shrub-like woody plants

Ac	Acer campestre	field maple
Ag	Alnus glutinosa	black (European) alder
Cm	Crataegus monogyna	common hawthorn
Cs	Cornus sanguinea	common dogwood
Fe	Fraxinus excelsior	common ash
Ps	Prunus spinosa	blackthorn, sloe
Rc	Rhamnus cathartica	purging buckthorn
Rs	Rosa spp.	varieties of wild rose
ScB	Salix cinerea-Bastard	bastard grey willow
Sr	Salix x rubens	hybrid crack-willow
St	Salix triandra	almond-leaved willow
StB	Salix triandra-Bastard	bastard almond leaved willow
Sv	Salix viminalis	basket willow
SvB	Salix viminalis-Bastard	bastard basket willow
Sn	Sambucus nigra	common elder

dead wood

stands of willow with undergrowth

Tall forb meadows

tall forbs

Reed beds

Phragmites australis

common reed

Phalaris arundinacea

reed canary grass

Iris pseudacorus

yellow flag (iris)

Carex spp.

varieties of sedge

Aquatic plants

Potamogeton pectinatus

fennel pondweed

Myriophyllum spicatum

Eurasian water milfoil

Grassland

Elymus repens s. str.

couch grass

Areas without vegetation cover

concreted area (slope etc.), stone blocks and the like

reed mulch

steep edge

planning section (no.)

Project: Studies on alternative technical-biological bank protection measures applied on inland waterways (R&D project)
Part 2: Test stretch Stolzenau/Weser Km 241.550 - 242.300

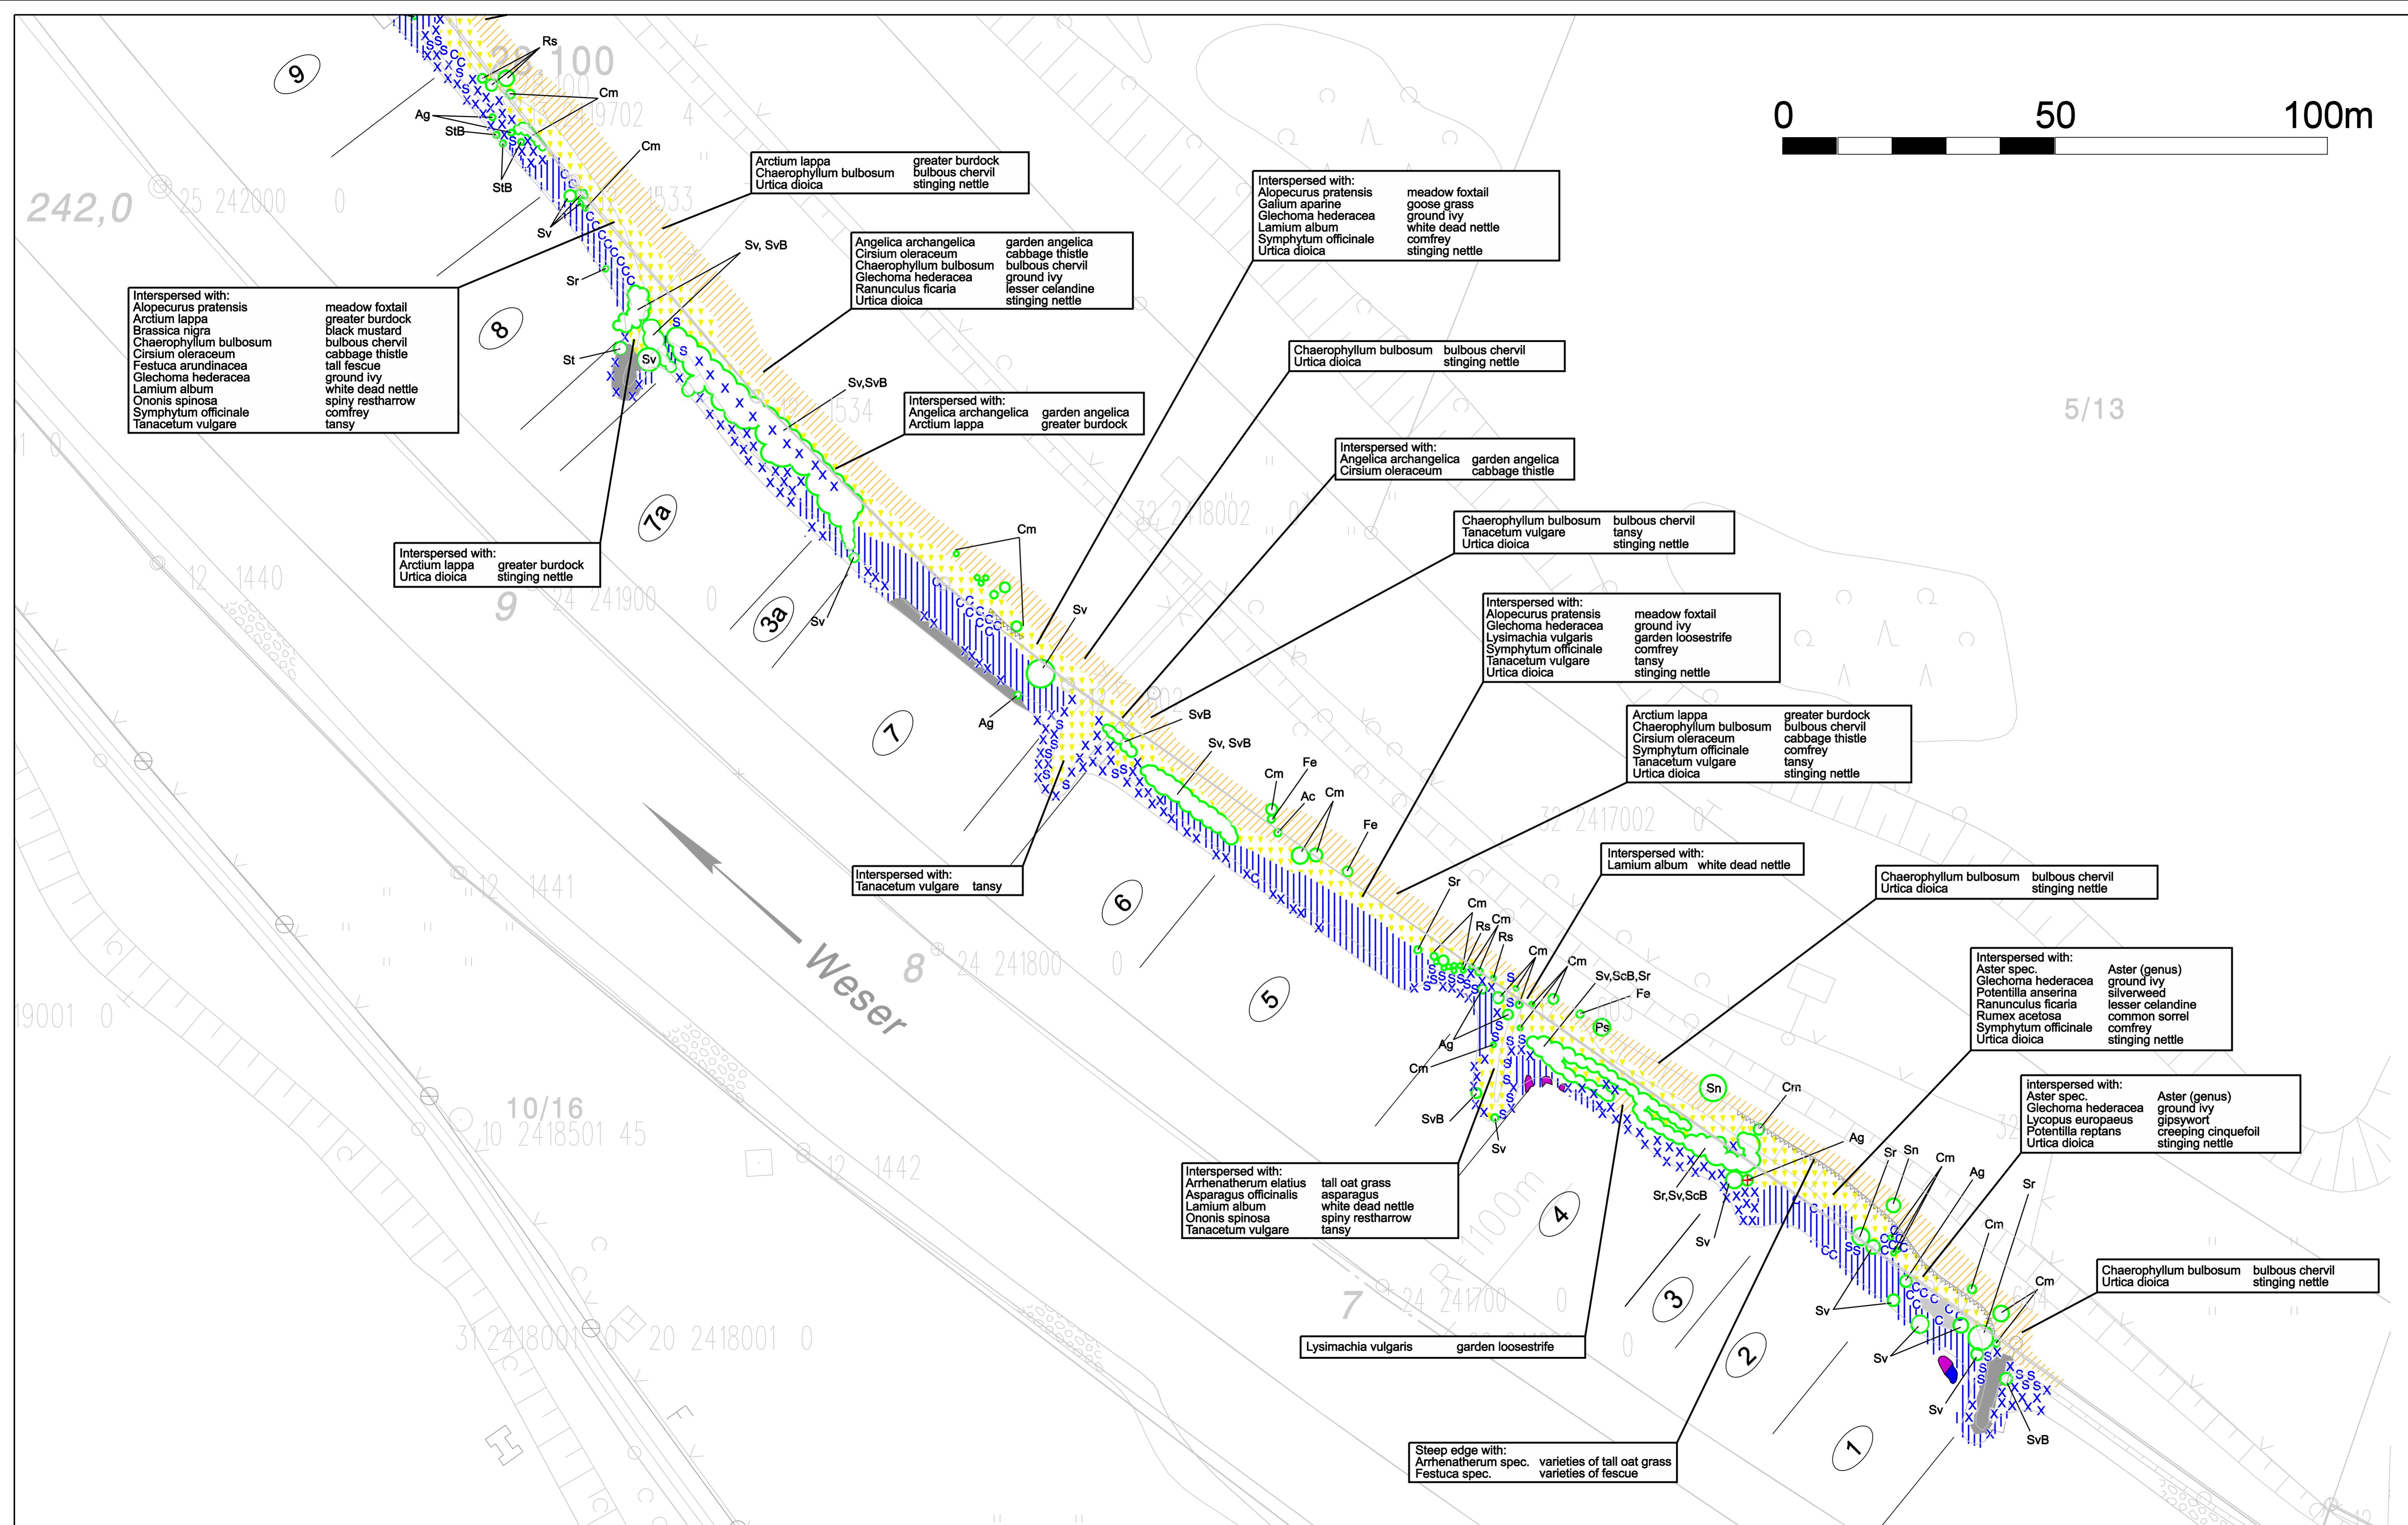

Type of plan: Vegetation and bank structure; survey from April 2005
Scale: 1:500 (original)
Appendix no.: 9.2.1

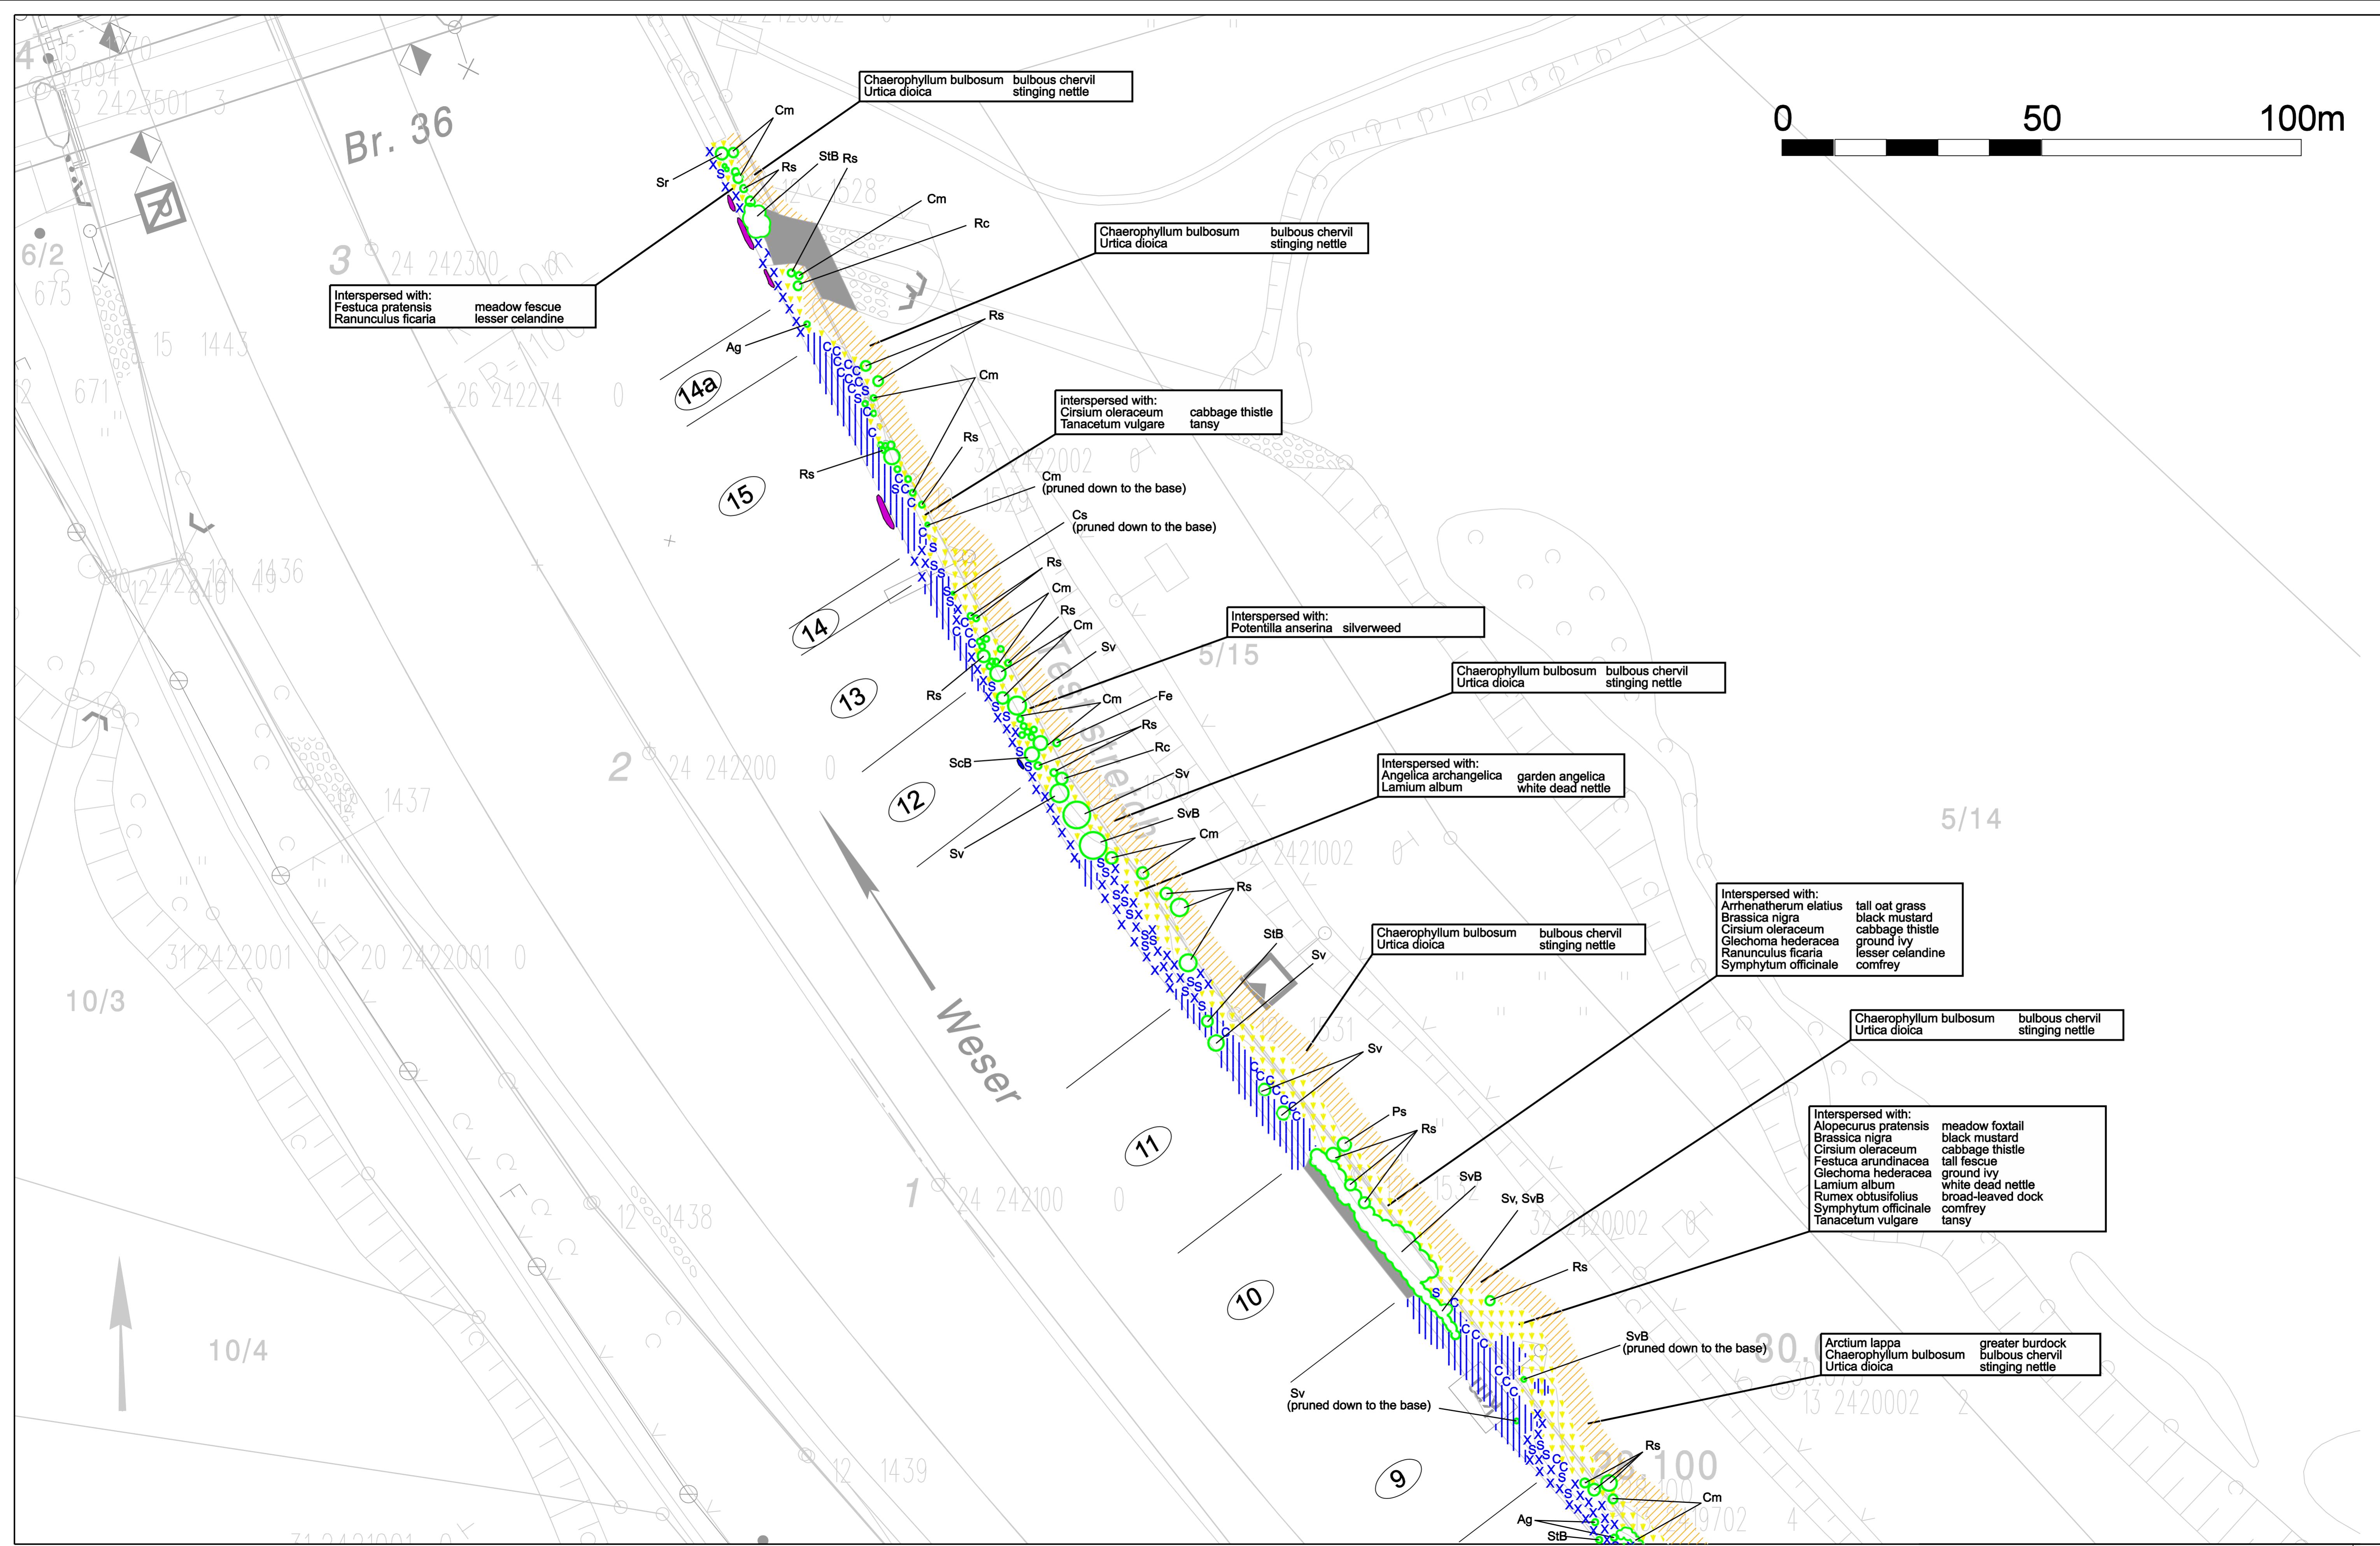

Prepared by: FEDERAL INSTITUTE OF HYDROLOGY KOBLENZ

Processed by: Herz / Bauer

CAD/GIS: Meyer / Buscher / Hoppe

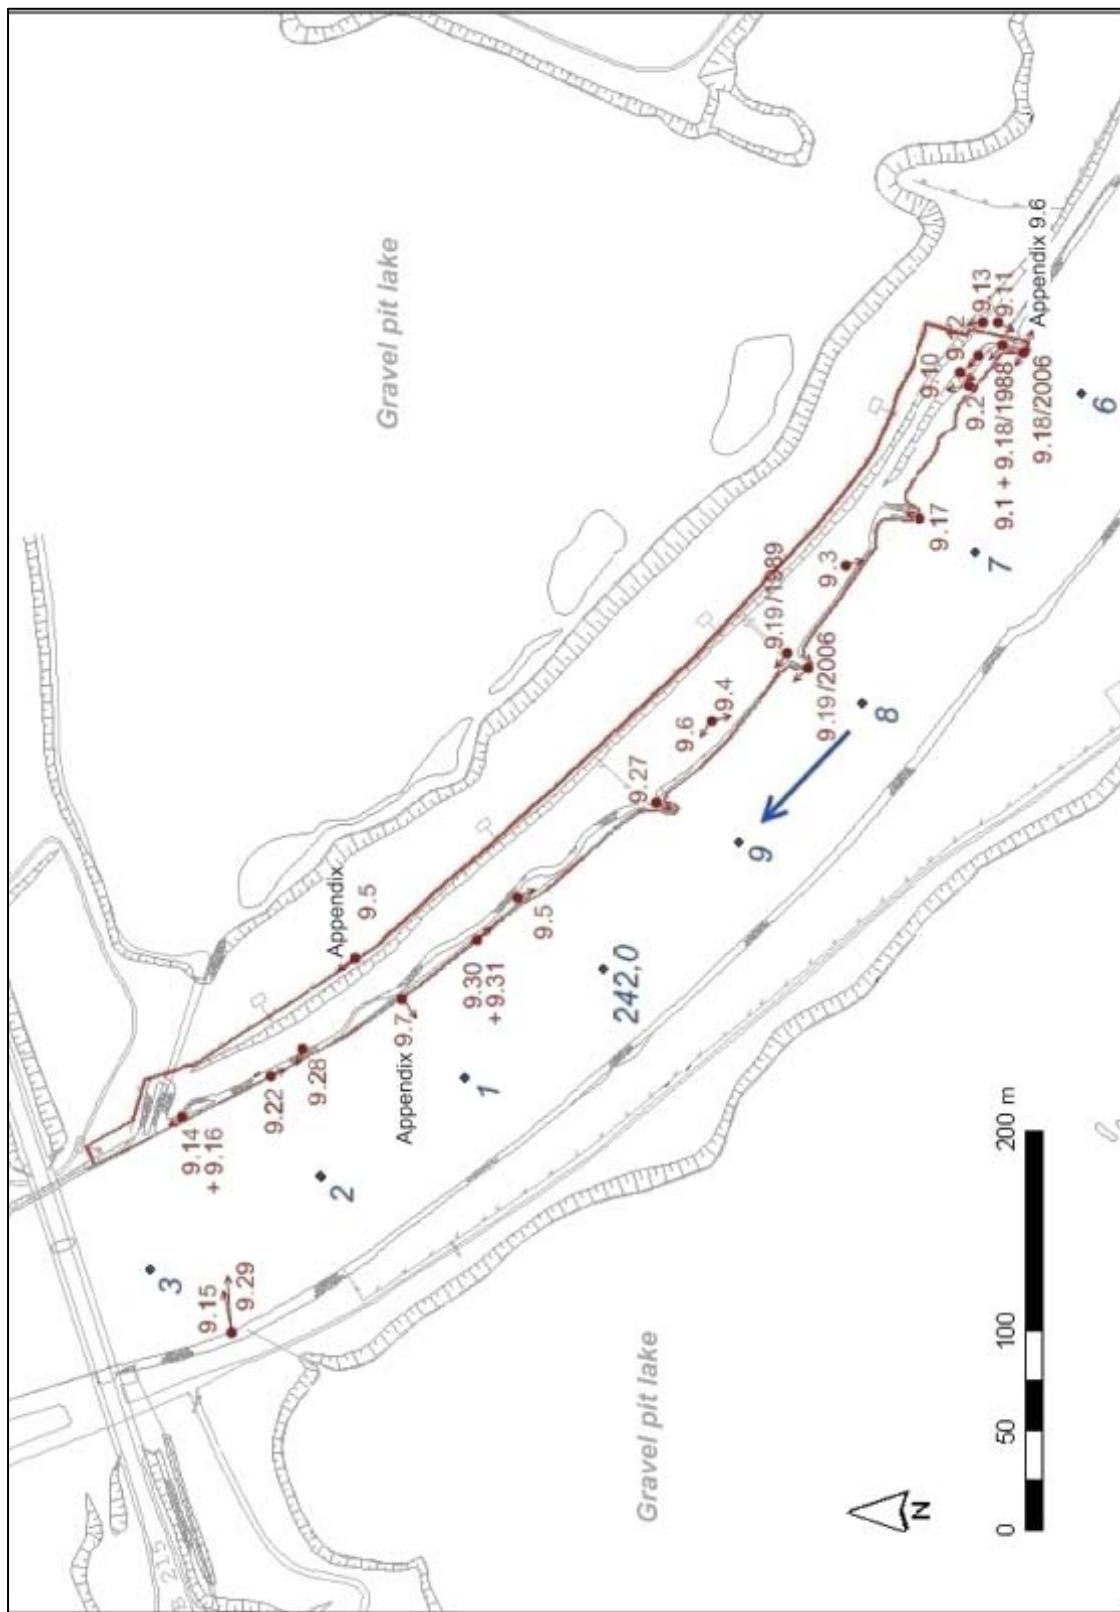

Issued: Dec. 2005 | Format modified: September 2008

Project:	Studies on alternative bank protection measures applied on inland waterways (R&D Project) Part 2: Test stretch, Stolzenau/River Weser Km 241.550 - 242.300	
Type of plan:	Photographic documentation	Maßstab: 1:500
	September 2006 at low water	Appendix: 9.4
Prepared by:	Federal Institute of Hydrology Koblenz	
Processed by:	Bauer	
CAD/GIS:	Diel	
Issued:	December 2006	Format modified: Januar 2008

Appendix 9.5

Hinterland (Km 242.100)

Appendix 9.5: Hinterland (Km 242.100): Fallow land dominated by stingling nettle (*Urtica dioica*) and bulbous chervil (*Chaerophyllum bulbosum*), landward side, adjoining cattle pasture (14.9.2006).

Appendix 9.6

Bank vegetation directly upstream from the test stretch

Appendix 9.6: Bank vegetation directly upstream from the test stretch: dominant type near the waterline is reed canary grass (*Phalaris arundinacea*) (14.9.2006, at low water).

Appendix 9.7

Bank opposite the test stretch (Km 242.100)

Appendix 9.7: Bank opposite the test stretch (Km 242.100): dominated by reed canary grass (*Phalaris arundinacea*) and tall forbs, with occasional willow shrubs (14.9.2006, at low water).

Appendix 9.8

Complete list of plant species in the test stretch

Appendix 9.8: List of all species of plants in the test stretch (April 2005 and September 2006)

	Red List Lower Saxony		Red List Lower Saxony
field maple (<i>Acer campestre</i>)	*	gipsywort (bugleweed) (<i>Lycopus europaeus</i>)	*
sneezewort (<i>Achillea ptarmica</i>)	*	garden loosestrife (<i>Lysimachia vulgaris</i>)	*
black or European alder (<i>Alnus glutinosa</i>)	*	purple loosestrife (<i>Lythrum salicaria</i>)	*
meadow foxtail (<i>Alopecurus pratensis</i>)	*	water mint (<i>Mentha aquatica</i>)	*
garden angelica (<i>Angelica archangelica</i>)	*	Eurasian water milfoil (<i>Myriophyllum spicatum</i>)	*
greater burdock (<i>Arctium lappa</i>)	*	spiny restarrow (<i>Ononis spinosa</i>)	n.s.
tall oat grass (<i>Arrhenatherum elatius</i>)	n.s.	reed canary grass (<i>Phalaris arundinacea</i>)	*
common wormwood (<i>Artemisia vulgaris</i>)	*	timothy (grass) (<i>Phleum pratense</i>)	*
asparagus (<i>Asparagus officinalis</i>)	*	common reed (<i>Phragmites australis</i>)	*
common Michaelmas daisy (<i>Aster x salignus</i>)	*	swamp meadow grass (<i>Poa palustris</i>)	*
black mustard (<i>Brassica nigra</i>)	n	smooth meadow grass (<i>Poa pratensis</i>)	*
hedge bindweed (<i>Calystegia sepium</i>)	*	fennel pondweed (<i>Potamogeton pectinatus</i>)	n.s.
welted thistle (<i>Carduus crispus</i>)	*	silverweed (<i>Potentilla anserina</i>)	*
slender-tufted sedge (<i>Carex acuta</i>)	*	creeping cinquefoil (<i>Potentilla reptans</i>)	*
lesser pond sedge (<i>Carex acutiformis</i>)	*	wild cherry (<i>Prunus avium</i>)	*
cypress-like sedge (<i>Carex pseudocyperus</i>)	*	blackthorn (sloe) (<i>Prunus spinosa</i>)	n.s.
brown knapweed (<i>Centaurea jacea</i>)	*	lesser celandine (<i>Ranunculus ficaria</i>)	*
bulbous chervil (<i>Chaerophyllum bulbosum</i>)	*	hairy buttercup (<i>Ranunculus cf. sardous</i>)	2
creeping thistle (<i>Cirsium arvense</i>)	*	purging buckthorn (<i>Rhamnus cathartica</i>)	*
cabbage thistle (<i>Cirsium oleraceum</i>)	*	dog rose (<i>Rosa canina</i>)	n.s.
common dogwood (<i>Cornus sanguinea</i>)	*	sweet-briar (<i>Rosa rubiginosa</i>)	n.s.
common hawthorn (<i>Crataegus monogyna</i>)	*	common sorrel (<i>Rumex acetosa</i>)	*
orchard grass (<i>Dactylis glomerata</i>)	*	broad-leaved dock (<i>Rumex obtusifolius agg.</i>)	*
couch grass (<i>Elymus repens</i> ssp. <i>repens</i>)	*	almond-leaved willow (<i>Salix triandra</i> agg.)	n.s.
tall fescue (<i>Festuca arundinacea</i>)	*	bastard almond-leaved willow (<i>Salix triandra-</i>)	n.s.
meadow fescue (<i>Festuca pratensis</i>)	*	basket willow (<i>Salix viminalis</i>)	*
common ash (<i>Fraxinus excelsior</i>)	*	bastard basket willow (<i>Salix viminalis-</i>)	n.s.
goose grass (<i>Galium aparine</i>)	*	hybrid crack-willow (<i>Salix x rubens</i>)	*
false baby's breath (<i>Galium album</i>)	*	black elder (<i>Sambucus nigra</i>)	*
ground ivy (<i>Glechoma hederacea</i>)	n.s.	climbing nightshade (<i>Solanum dulcamara</i>)	*
common hogweed (<i>Heracleum sphondylium</i>)	n.s.	Canada golden rod (<i>Solidago canadensis</i>)	*
St. John's wort (<i>Hypericum perforatum</i>)	*	marsh woundwort (<i>Stachys palustris</i>)	*
British yellowhead (<i>Inula britannica</i>)	3	wood stitchwort (<i>Stellaria nemorum</i>)	*
yellow flag (<i>Iris pseudacorus</i>)	*	comfrey (<i>Symphytum officinale</i> s. l.)	*
white dead nettle (<i>Lamium album</i>)	*	tansy (<i>Tanacetum vulgare</i>)	*
spotted deadnettle (<i>Lamium maculatum</i>)	*	scentless false mayweed (<i>Tripleurospermum</i>)	*

	Red List Lower Saxony		Red List Lower Saxony
		<i>perforatum)</i>	
autumn hawkbit (<i>Leontodon autumnalis</i>)	*	stinging nettle (<i>Urtica dioica</i> agg.)	*
common toadflax (<i>Linaria vulgaris</i>)	*		

3: threatened

*: not threatened

n: neophyte

n.s.: non specified

The yellow flag (*Iris pseudacorus*) is strictly protected under the Federal Ordinance on the Conservation of Species /BGBI/.

**Specification
test stretch Stolzenau,
River Weser
Km 241.550 – 242.300,
right bank**

SPECIFICATION

Test section Stolzenau, River Weser Km 241.55 – 242.30, right bank

Technical-Biological Bank Protection Measures and Boundary Conditions

(1) Bank protection methods and their evaluation	Planting methods	Success of planting	Value regarding nature protection ⁷⁾
	Planting common reed and sedges		
	a) <u>Planting plugs and sods of common reed</u> on flattened bank slopes protected by stone mounds or berms, in some stretches additionally with fascines or vegetation fabric	Very good	Very high value ⁵⁾
	b) <u>Planting plugs and sods of common reed</u> on steep bank slopes where stones have been removed, protected by vegetation fabric	Good	Medium to high value ⁶⁾
	c) <u>Planting plugs and sods of common reed</u> on unmodified bank slopes (i.e. steep and protected with armour stones) with or without protection from training structures or fascines	Good	Medium to high value ⁶⁾
	d) <u>Planting plugs and sods of sedges</u> ; varying topography and protection as in a) to c)	Good ¹⁾	Of medium value
	e) <u>Reed mats</u> on flattened bank slope	Moderate ²⁾	-
	Planting woody plants		
	f) <u>Willow cuttings and long branch cuttings</u> on flattened bank slopes protected by training structure or stone mound	Very good	Medium to high value
	g) <u>Willow cuttings and long branch cuttings</u> on unmodified bank slope, if placed close to the water line and protected by stone mound	Very good	Medium to high value
	h) <u>Brush mattresses of willows</u> on flattened as well as on steep bank slopes, if armour stones have previously been removed	Very good	Medium to high value
	i) <u>Alder plantings</u> in the upper part of unmodified bank slopes	Failed ³⁾	-
	j) <u>Willow cuttings and long branch cuttings</u> if placed in the upper part of the (flattened or unmodified) bank slope	Failed ⁴⁾	-
(2) Body responsible for project	WSA Verden, in cooperation with BfG and BAW		
(3) Start year	1988/89		
(4) Monitoring	Examined and documented between 1989 and 2007: waterway geometry, ground, ground water and river water levels, hydraulic bank load resulting from navigation and natural river flow, vegetation, birds, fish, macrozoobenthos		

¹⁾ In 2005 often still in places where originally planted, without any tendencies to spread

²⁾ In the first years, the common reed plants of the mats showed poor growth and low vitality. The later development cannot clearly be retraced.

³⁾ Probably dried up (due to lack of precipitation and irrigation) or affected by the lethal alder disease (*phytophthora*)

⁴⁾ Presumably dried up (due to lack of precipitation and irrigation)

⁵⁾ In 2005 wide common reed stands, i.e. also of benefit to fauna

⁶⁾ In 2005 relatively narrow, though vital common reed stands

⁷⁾ By 2005, the test section achieved, as a whole, a high value in terms of nature protection; this was due to its habitat diversity i.e. the way in which the planted and unplanted sections had developed.

Note: Below the water level (mean low water) the slopes – with a continuous inclination of 1 : 3 – are protected with class III armour stones in accordance with TLW 1993 (*TLW – Technical supply conditions for armorstones*).

(5) Bank geometry	<ul style="list-style-type: none"> - slip-off slope - slope inclinations 1 : 3.5 to 1 : 7 (1 : 8) - partly with stone mound in front of alternative protection measures, shallow water zone, training structure or berm <p>In the test section only minor changes in the slope geometry had occurred by 2007. Even relatively steep slope sections, where riprap had been replaced by live brush mattresses or reed beds, had remained stable to a very large extent.</p>																				
(6) Ground	<p>In the immediate bank area, up to approx. 3 m below the upper edge of the terrain (corresponding roughly to the mean low water level) the native soil mainly consists of silts bearing sandy or clayey constituents and partly also of silty or gravelly sands. Below this, the Weser Gravel begins (intermittently to widely graded medium to coarse sandy gravel, 0.2 mm to 60 mm) with a depth of 6 to 8 m.</p>																				
(7) Navigation	<p>Number of vessels (calculated from number of lockings)</p> <p><u>Freighters:</u> approx. 500 / year; approx. 20 / working day</p> <p><u>Recreational, passenger, other vessels:</u> approx. 100 / year (journeys within the reach are <u>not recorded!</u>)</p> <p>Dimensions (mean/maximum from down- and upstream travel taken from traffic observation)</p> <p><u>Freighters</u> (motor cargo and motor tank vessels, push-tow units)</p> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%;">Length:</td> <td style="width: 50%;">76 m (max. 114 m)</td> <td style="width: 50%; text-align: right;"><u>Recreational craft</u></td> <td style="width: 50%;">Length: 9.1 m (max. 15 m)</td> </tr> <tr> <td>Width:</td> <td>8.5 m (max. 9.5 m)</td> <td>Width:</td> <td>3.4 m (max. 4 m)</td> </tr> <tr> <td>Draught:</td> <td>1.8 m (max. 2.5 m)</td> <td>Draught:</td> <td>1 m (max. 1.6 m)</td> </tr> </table> <p>Data on journeys (minimum/mean/maximum from down- and upstream travel taken from traffic monitoring)</p> <p><u>Freight ships</u> (motor cargo and motor tank vessels, push-tow units)</p> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%;">Distance from the bank:</td> <td style="width: 50%;">52 m (min. 38 m / max. 67 m)</td> </tr> <tr> <td>Vessel speed:</td> <td>11.5 km/h (min. 7.0 km/h / max. 16.5 km/h)</td> </tr> </table> <p><u>Recreational craft</u></p> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%;">Distance from the bank:</td> <td style="width: 50%;">47 m (min. 15 m / max. 75 m)</td> </tr> <tr> <td>Vessel speed:</td> <td>16.4 km/h (min. 7.7 km/h / max. 58 km/h)</td> </tr> </table>	Length:	76 m (max. 114 m)	<u>Recreational craft</u>	Length: 9.1 m (max. 15 m)	Width:	8.5 m (max. 9.5 m)	Width:	3.4 m (max. 4 m)	Draught:	1.8 m (max. 2.5 m)	Draught:	1 m (max. 1.6 m)	Distance from the bank:	52 m (min. 38 m / max. 67 m)	Vessel speed:	11.5 km/h (min. 7.0 km/h / max. 16.5 km/h)	Distance from the bank:	47 m (min. 15 m / max. 75 m)	Vessel speed:	16.4 km/h (min. 7.7 km/h / max. 58 km/h)
Length:	76 m (max. 114 m)	<u>Recreational craft</u>	Length: 9.1 m (max. 15 m)																		
Width:	8.5 m (max. 9.5 m)	Width:	3.4 m (max. 4 m)																		
Draught:	1.8 m (max. 2.5 m)	Draught:	1 m (max. 1.6 m)																		
Distance from the bank:	52 m (min. 38 m / max. 67 m)																				
Vessel speed:	11.5 km/h (min. 7.0 km/h / max. 16.5 km/h)																				
Distance from the bank:	47 m (min. 15 m / max. 75 m)																				
Vessel speed:	16.4 km/h (min. 7.7 km/h / max. 58 km/h)																				
(8) Hydraulic loads	<p><u>Shear stress (τ):</u> $\leq 6 \text{ N/m}^2$</p> <p><u>Flow velocity (v):</u> $\leq 1 \text{ m/s}$</p> <p><u>Wave heights:</u></p> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%;">Drawdown:</td> <td style="width: 50%;">0.14 m (max. 0.39 m)</td> </tr> <tr> <td>Stern waves:</td> <td>0.15 m (max. 0.64 m)</td> </tr> <tr> <td>Secondary waves:</td> <td>0.06 – 0.08 m (max. 0.41 m)</td> </tr> </table> <p>All values given here refer to the loads in the bank area by 2007. Shear stress and flow velocity values are noticeably below the load-bearing capacity limits – known from the literature – of the technical-biological bank protection measures applied here. The ship-induced waves mentioned here can be absorbed by the bank protection measures without damage. As limiting values for the capacity of bearing load resulting from ship waves are not yet known from the literature, further experience needs to be made within this research project in order to make valid statements as to whether waves higher than those measured here can be absorbed without damage.</p>	Drawdown:	0.14 m (max. 0.39 m)	Stern waves:	0.15 m (max. 0.64 m)	Secondary waves:	0.06 – 0.08 m (max. 0.41 m)														
Drawdown:	0.14 m (max. 0.39 m)																				
Stern waves:	0.15 m (max. 0.64 m)																				
Secondary waves:	0.06 – 0.08 m (max. 0.41 m)																				
(9) Evaluation of fauna	<p>In spring and summer 2006 the area with alternative bank protection and, as a reference, an area of traditional bank protection were examined regarding animal ecology. For this purpose, inventories were taken of birds, fish (especially juvenile fish) and macrozoobenthos. This revealed an increased density of juvenile fish as well as a higher diversity of birds and macrozoobenthos in the alternatively protected bank section, including some Red List species. Therefore the evaluation of the alternative bank protection applied in the Stolzenau stretch has a positive result regarding animal ecology. Continued monitoring in a 5 to 10 year rhythm would be desirable.</p>																				
(10) Overall result	<p>After 20 years of operation, the current state of the technical-biological bank protection measures can be estimated as being very good – with the exception of the issues stated under (1). Under the given boundary conditions, almost all planting measures could develop in a positive manner. The bank protection provides good protection from erosion. The banks are in a stable condition. From the perspective of the WSA, so far no maintenance measures have been necessary. (Future maintenance needs are referred to in the report.)</p>

Appendix 12.2

Recommendations for a monitoring programme

Recommendations for a monitoring programme

Objective: If bank protection along a federal waterway is implemented using alternative technical-biological measures, the following monitoring programme is recommended for documenting the success and durability of these measures.

Waterway geometry	→ Measuring of cross sections in the bank zone, including river bed and slope, using a sufficiently fine grid, before and after the measure (immediately after implementation, and subsequently once per annum).
Hydrology/ hydraulics	→ Documentation of the water level hydrograph → Documentation of the discharge hydrograph → Measuring and documentation of flow velocities (volume, direction) in the area of the measure; the proportion of influence from shipping should also be documented as far as possible – if necessary, repeat measurements once after installation of the bank protection measures. → Measurement and documentation of water level fluctuations in the area of the measures; the proportion of influence from shipping should also be documented as far as possible
Ground	→ Ground assessment (ground expertise or additional exploratory borings should be available.) → Documentation of the groundwater situation – documentation of ground water levels in the hinterland
Navigation	→ Documentation of the current navigation fleet (ship types) → Recording of typical technical data of the ships (length, width, draught, type of propulsion, engine capacity) → Documentation of traffic density - traffic statistics (e.g. using lock records)
Fauna	→ Inventory / documentation: before and immediately after construction, and after 1, 3, 6 and 10 years
Vegetation	→ Inventory / documentation: before and immediately after construction, and after 1, 3, 6 and 10 years; subsequently every 10 years, if needed → Maintenance plan (monitoring every 10 years and, if required, improvements)
General	→ Photographic documentation at suitable intervals (annually)
